

(I) CLAIM OR CLAIMS: I, Dennis M. Dearie, is the sole designer of a Windows based software program titled: Insurance Verification System hereafter called I.V.S. I found a weekness in the enforcement of mandated liability auto insurance laws. In July 2000 I formed a company, DesignScan, Inc. to work on solving this loophole. With the advancement of computers and color printers many people were printing out fake insurance cards and presenting them as proof of coverage at insurance check-points. Our I.V.S. system is secure and is only assessable by having a unique "log in" and password. Insurance companies upload main information on the vehicle and registered owner. They then must pass inspection at a state certified inspection station. At that time all previous information is checked by issuing inspection station. They in turn affix a state approved barcode labeled inspection sticker on the inside lower left corner. The sticker is a "read only" style that contains all preloaded pertinent information. Upon going through the next insurance check point the sticker will be a "stand alone" for registration, inspection and active insurance policy being effective. Individual insurance companies use our system to update policies in "real-time". There's no need waiting for the postal service to deliver notices on the status of an insurance policy. Updates such as renewals or cancellations can be uploaded immediately or at a scheduled time depending on which that company chooses.
